Searches for Techniparticles at DØ

Lorenzo Feligioni

Boston University

for the DØ collaboration

- Technicolor Phenomenology
- Signatures:
  - W $\pi_T \rightarrow$ e ν b $\bar{b}/\bar{c}$
  - $\omega_T/\rho_T \rightarrow e^+e^-$
- Cross Section Limits

Technicolor Physics

- Mechanism of electroweak symmetry breaking
  - Standard Model and Supersymmetry:
    - Higgs field ⇒ Higgs boson
      - **Weakly coupled, light fundamental scalar**
  - Technicolor:
    - New strong dynamics: SU(N_{TC}) gauge theory analog to QCD
    - N^2_{TC} - 1 new gauge bosons: technigluons
    - In analogy with QCD breaking of the chiral symmetry produces Goldstone bosons (technipions):
      - 3 technipions are eaten to become W_L and Z_L
      - others could be observed at collider experiments

Low Scale Technicolor Models

- Large numbers of technifermions are the natural choice for several Technicolor Models
  - Walking Technicolor
    - Evade large flavor changing neutral current
  - Topcolor-assisted Technicolor
    - Many technifermions are needed to generate hard masses for quarks and leptons
  - **Technicolor Straw Man Model (TCSM2):** K. Lane, S. Mrenna hep-ph/02110299
    - Set the scale for calculating lowest-lying bound state of lightest technifermion doublets
    - color singlet vectors (200 – 400 GeV)
      - produced in pp collisions
        - » Decays:

$\omega_T \to \gamma\pi_T$, γZ, $3\pi_T$, f f,g g

$\rho_T \to \pi_T\,\pi_T$, $W\pi_T$, $Z\pi_T$, WW, f f,g g

$\rho_T \to \pi_T\,\pi_T$, $W\pi_T$,$Z\pi_T$, WZ

    - color-singlet scalars
      - lightest technihadrons π_T^0 $\pi_T^{+/-}$
        - » Decays:

$\pi_T \to$ ff,gg ($\pi_T^0 \to bb$, $\pi_T^{+/-} \to bc$ dominate)

Previous Searches

- TCSM2 Parameters:
  - N_D : number of technifermion doublets
  - $Q_D = Q_U - 1$: technifermion charge
  - $\sin\chi$: mixing angle
  - M_V : mass parameter (it controls technifermions coupling and decay mode)
- Previous searches

CDF RunI

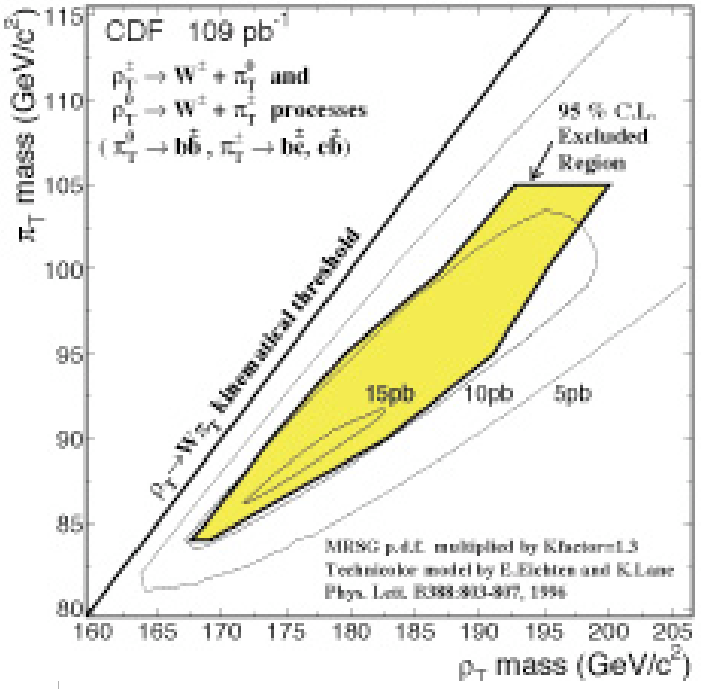
- $W\pi_T$ and $\omega_T \rightarrow \gamma\pi_T$
- $M_V = 100$

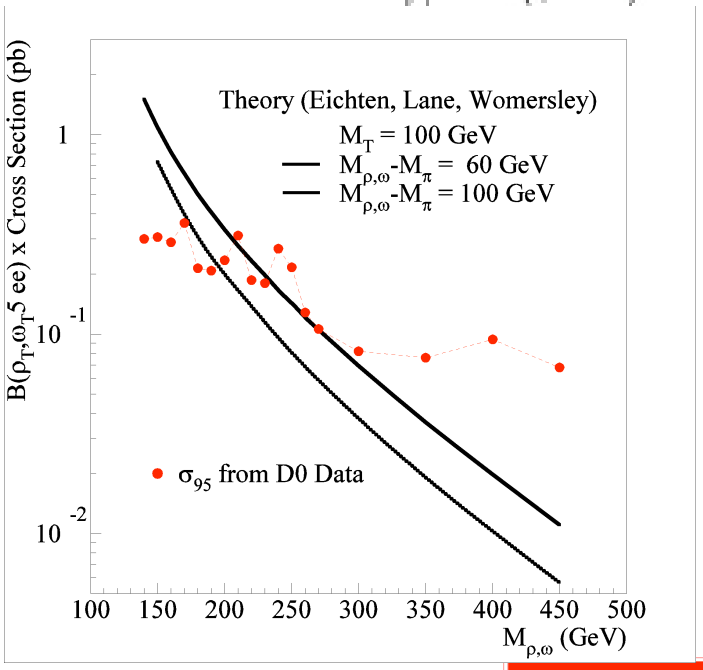
DØ RunI

- $\rho_T/\omega_T \rightarrow ee$
- $M_T = M_V = 100$ to 400
- $M(\rho_T/\omega_T) - M(\pi_T) = 60, 100$ GeV
  - $M_V = 100$ GeV $\Rightarrow W\pi_T$ channel open

LEP

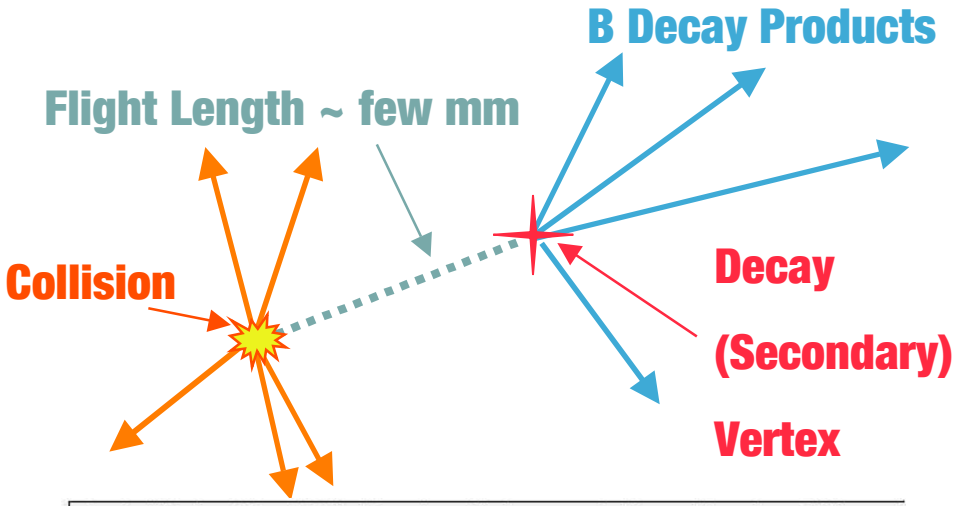
- $\rho_T \rightarrow WW$, $\rho_T \rightarrow \pi_T W$ (DELPHI)
- $M(\pi_T) = 105$ GeV $M(\rho_T) = 200$ GeV is excluded for some TCSM parameters

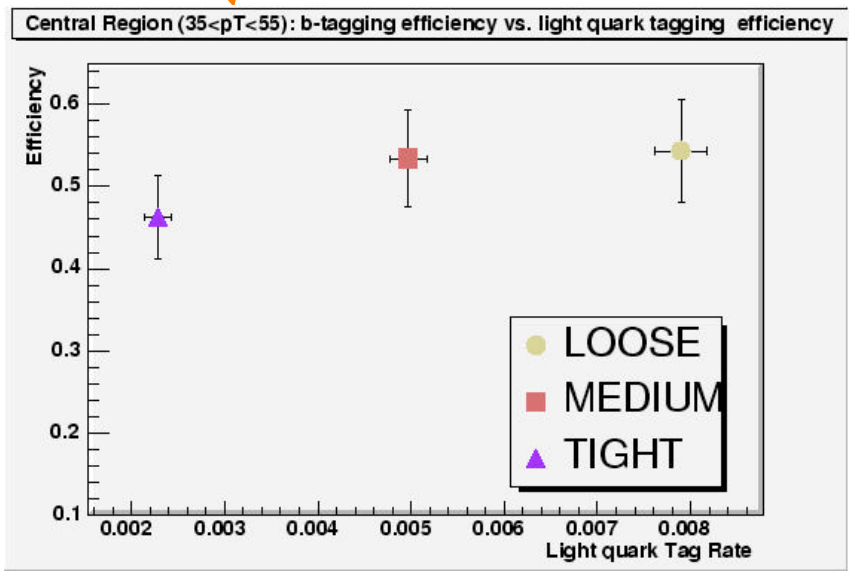




$W\pi_T$ Events Selection

- One reconstructed Primary Vertex
- One isolated electron
  - veto on the presence of another electrons suppress Z contamination
- Missing E_T > 20 GeV
  - eliminates multi-jets (QCD)
- Two calorimeter jets
  - Veto on a third jet, suppresses tt background
  - At least one jet has to be associated with a Secondary Vertex (b-tagging)
- $M_T(W)$ > 30 GeV
- E_T^W ($p_T(e)$ + missing E_T) > 65 GeV





$W\pi_T$ Searches

$M(\pi_T)$ = 105 GeV $M(\rho_T)$=200 GeV

Cross sections ($W\rightarrow e\nu$), M_V=200:

- $W\pi_T^{+/-}$ ~ 3.7 pb
- $W\pi_T^{0}$ ~ 2.9 pb

$\int \mathcal{L}\, dt$ = 238 pb^{-1}

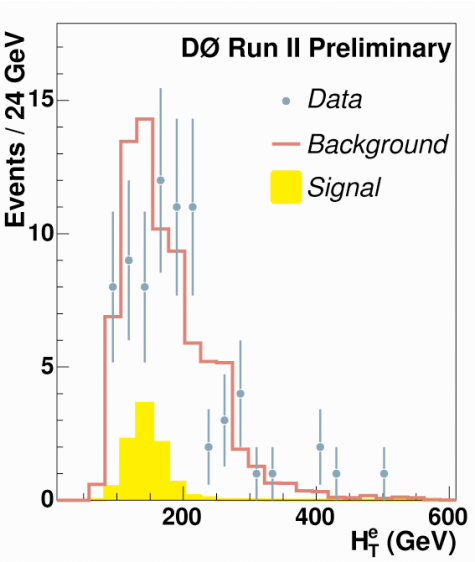
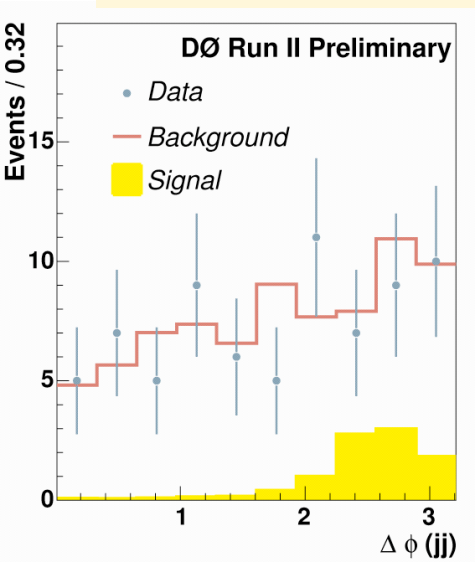
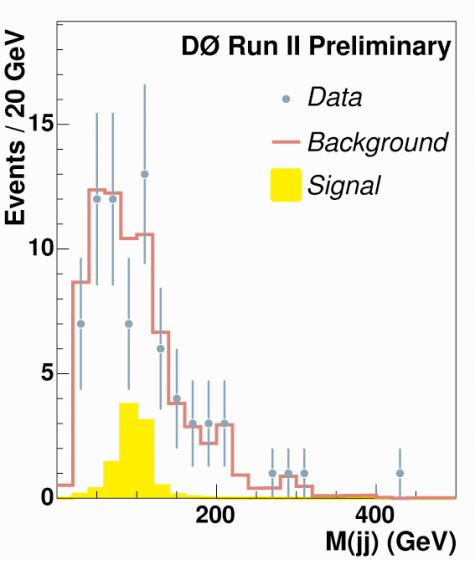
$W\pi_T$ Optimization

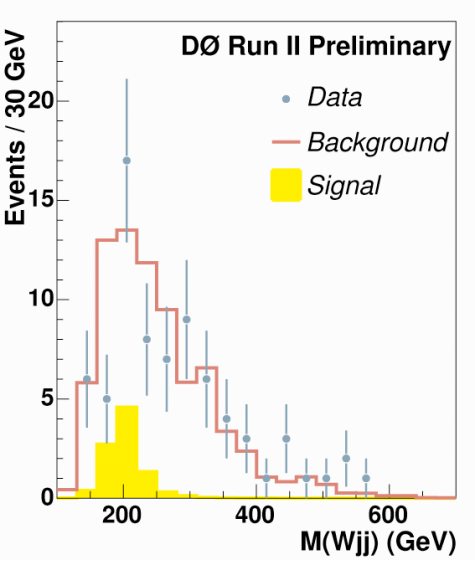
$\int \mathcal{L}\, dt = 238\ pb^{-1}$

- H_T^e (electron p_T + Σ jet p_T)
- $p_T(jj)$ (p_T of the dijet system)
- $\Delta\phi(jj)$
- M(jj) (invariant mass of the dijet system)
- M(Wjj) (invariant mass of the W + dijet system)







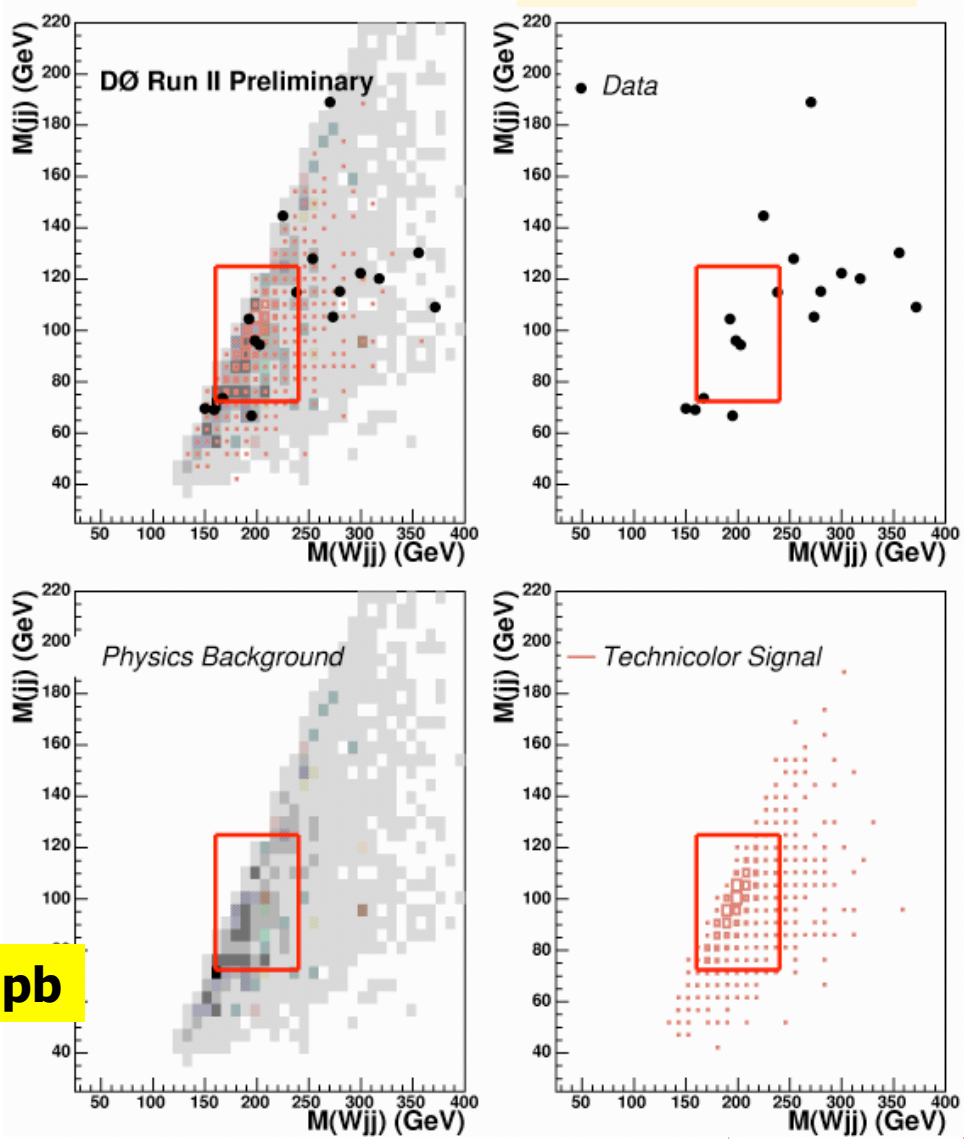


$W\pi_T$ Cross Section Limit

$\int \mathcal{L}\, dt$ = 238 pb^{-1}

- $\Delta\phi(jj) > 2.2$
- $p_T(jj) > 75$ GeV
- $H_T^e < 200$ GeV
- Mass Window

	data	background	signal
Baseline + $\Delta\phi$	28	28.3±7.1	7.5±1.1
+ $p_T(jj)$	22	24.7±6.2	7.4±1.1
+ H_T^e	17	18.3±4.6	7.2±1.1
+ mass window	4	6.6±1.6	6.2±0.9

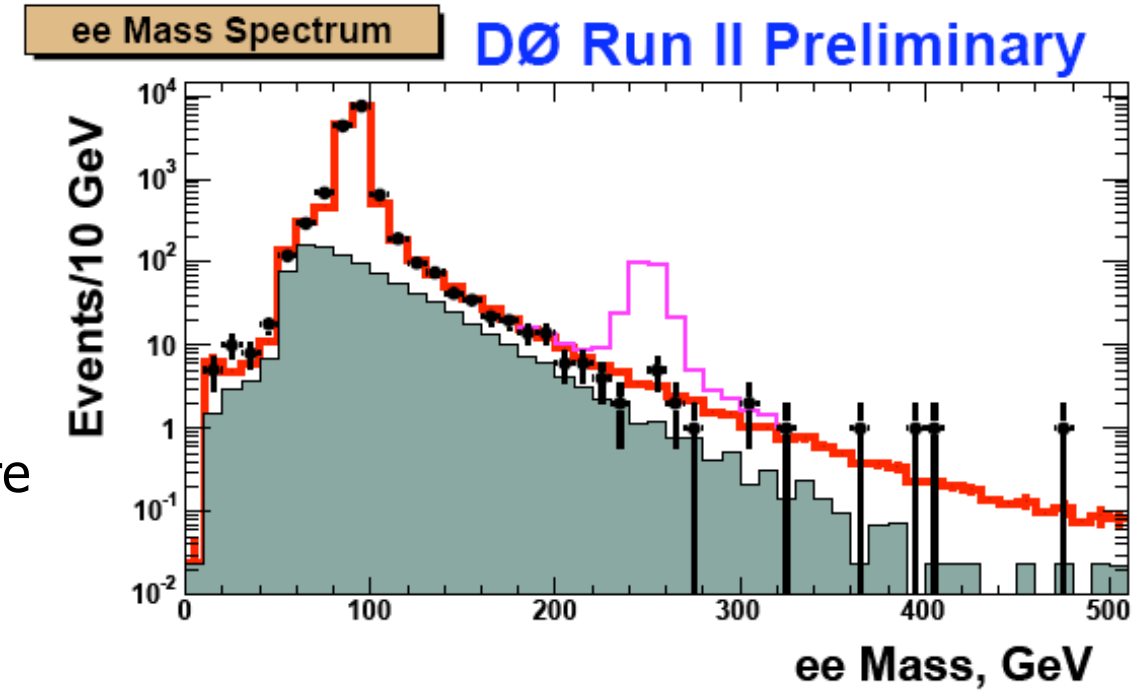


Cross section 95% C.L. upper limit 6.4 pb

$\omega_T/\rho_T \rightarrow e^+e^-$

$\int \mathcal{L}\, dt$ = 200 pb^{-1}

- Events with 2 high p_T electrons are selected
- Background
  - Drell-Yan production
  - QCD
- Search for $\rho_T/\omega_T \rightarrow e^+e^-$ as a bump/excess at high dielectron mass
- Intrinsic widths of ρ_T,ω_T are about 0.5 GeV
  - Thus resonance width dominated by detector resolution



$\omega_T/\rho_T \rightarrow e^+e^-$ Limits

$\int \mathcal{L}\, dt$ = 200 pb^{-1}

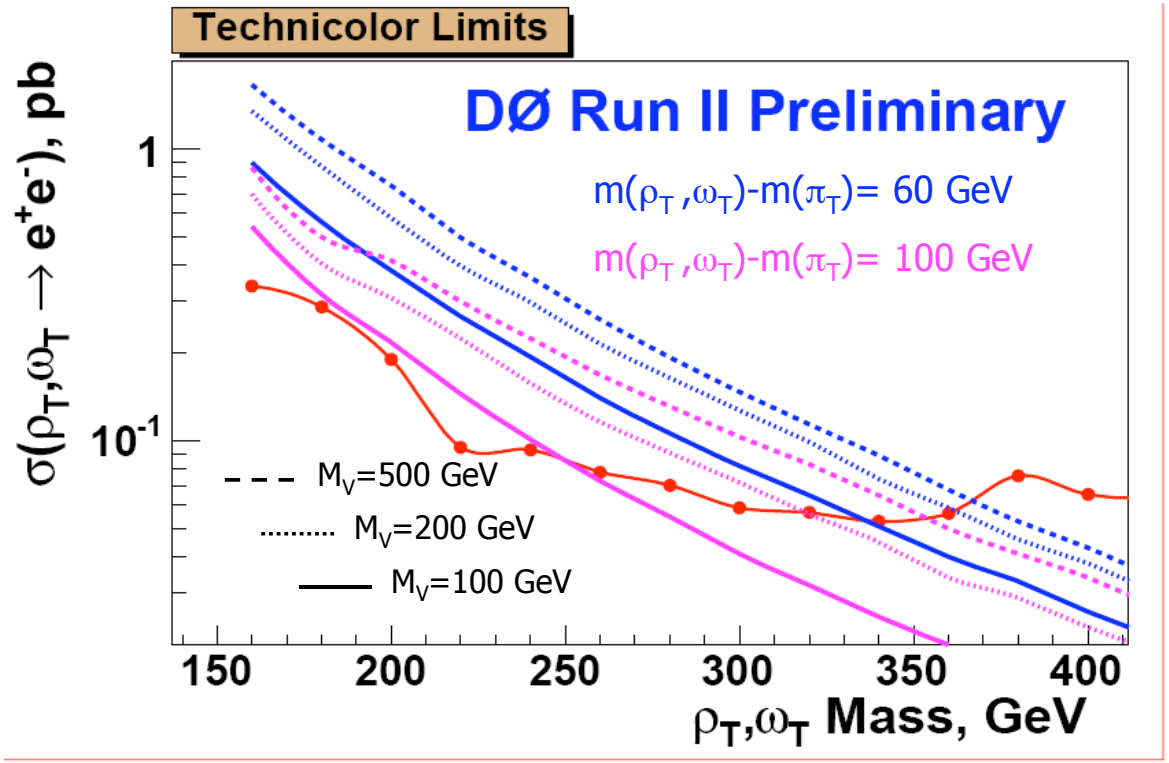
❖95% C.L.

➢$m(\rho_T,\omega_T)$-$m(\pi_T)$=60GeV

- $m(\rho_T,\omega_T)$ > 367 GeV for M_V = 500 GeV
- $m(\rho_T,\omega_T)$ > 340 GeV for M_V = 100 GeV

➢$m(\rho_T,\omega_T)$-$m(\pi_T)$=100 GeV

- $m(\rho_T,\omega_T)$ > 355 GeV for M_V = 500 GeV
- $m(\rho_T,\omega_T)$ > 240 GeV for M_V = 100 GeV



Summary

- DØ has begun to search for Technicolor particles in the W+2 jets channel
  - New b-tagging capability respect to RunI
  - No evidence were found for the π_T, ρ_T mass combination considered
- $\rho_T/\omega_T \rightarrow$ ee analysis
  - Most restrictive constraints on dilepton technicolor decays to date
- Outlook:
  - Almost twice more luminosity available for these analysis
  - Add μ channels soon
